What are differences between $(document).ready and $(window).load?

$(document).ready();

```
$(document).ready(function() {
 /** Add your code here **/

/** Add your code here **/

 console.log("HTML Document is fully load. HTML, javaScript and CSS is fully loaded.");
});
```

JavaScript code written inside **$(document).ready** will be called when **HTML Document is fully loaded**. It means JavaScript code will be called just after **HTML, JavaScript** & **CSS** is fully loaded.

$(window).load();

```
$(window).load(function() {
 /** Add your code here **/
```

```
/** Add your code here **/

 console.log("Web page fully Loaded. HTML, Javascript, CSS, Images, Iframes and objects
are fully loaded.");
});
```

JavaScript code written inside $(window).load will be called when **Web page fully Loaded**. It means JavaScript code will be called just after **HTML, Javascript, CSS, Images, Iframes** and **objects** are fully loaded.

Following document ready have same meaning and work as same.

```
$(document).ready(function(){

});
```

OR

```
$(function(){

});
```

OR

```
$(document).on('ready', function(){
})
```
